Dynamics Parameters

Input Channels feature two dynamics processors: Dynamics 1 and Dynamics 2. Output Channels feature one dynamics processor.

You can select any dynamics processor from the following six types:

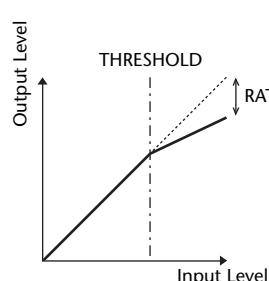

LEGACY COMP, COMP260, GATE, DE-ESSER, EXPANDER and DUCKING.

■ LEGACY COMP

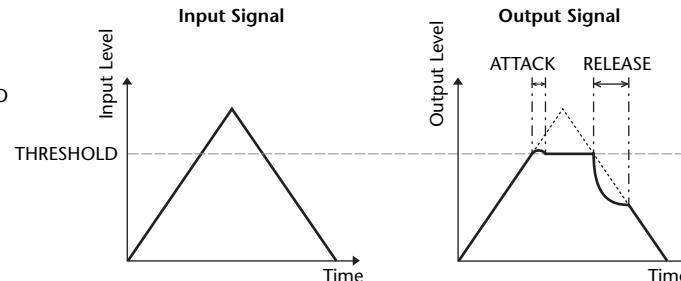

The COMP processor attenuates signals above a specified THRESHOLD by a specified RATIO. The COMP processor can also be used as a limiter, which, with a RATIO of $\infty:1$, reduces the level to the threshold. This means that the limiter's output level never actually exceeds the threshold.

Parameter	Range	Description
THRESHOLD	-60.0 to 0.0 (dB)	This determines the level of input signal required to trigger the compressor.
RATIO	1:1 to $\infty:1$	This determines the amount of compression, that is, the change in output signal level relative to change in input signal level.
ATTACK	0 to 120 (msec)	This determines how soon the signal will be compressed once the compressor has been triggered.
RELEASE	3.34m to 42.7 (sec)	This determines how soon the compressor returns to its normal gain once the trigger signal level drops below the threshold. The value is expressed as the duration required for the level to change by 6 dB.
OUT GAIN	-20.0 to +40.0 (dB)	This sets the compressor's output signal level.
KNEE	Hard, Soft-1, Soft-2, Soft-3, Soft-4, Soft-5	This determines how compression is applied at the threshold. For higher knee settings, compression is applied gradually as the signal exceeds the specified threshold, creating a more natural sound.

■ COMP260

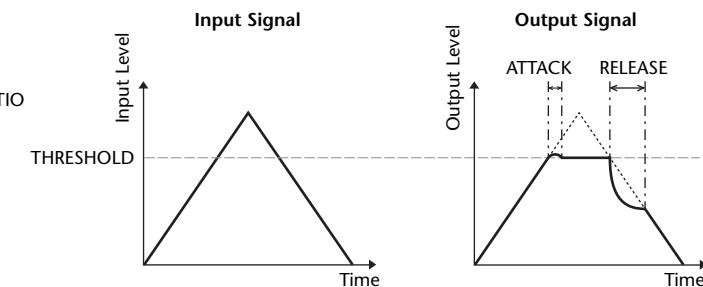

The COMP processor attenuates signals above a specified THRESHOLD by a specified RATIO. The COMP processor can also be used as a limiter, which, with a RATIO of $\infty:1$, reduces the level to the threshold. This means that the limiter's output level never actually exceeds the threshold.

Parameter	Range	Description
THRESHOLD	-60.0 to 0.0 (dB)	This determines the level of input signal required to trigger the compressor.
RATIO	1:1 to $\infty:1$	This determines the amount of compression, that is, the change in output signal level relative to change in input signal level.
ATTACK	0.01 to 80 (msec)	This determines how soon the signal will be compressed once the compressor has been triggered.
RELEASE	6.2m to 999 (sec)	This determines how soon the compressor returns to its normal gain once the trigger signal level drops below the threshold. The value is expressed as the duration required for the level to change by 6 dB.
OUT GAIN	-20.0 to +40.0 (dB)	This sets the compressor's output signal level.
KNEE	Hard, Soft-1, Soft-2, Soft-3, Soft-4, Soft-5	This determines how compression is applied at the threshold. For higher knee settings, compression is applied gradually as the signal exceeds the specified threshold, creating a more natural sound.

RANGE	$-\infty$, -72.0 to 0.0 (dB)	This determines the amount of attenuation when the gate closes.
ATTACK	0 to 120 (msec)	This determines how fast the gate opens when the signal exceeds the threshold level.
HOLD	0.02m to 1.96 (sec)	This determines how long the gate stays open once the trigger signal has fallen below the threshold.
DECAY	3.34m to 42.7 (sec)	This determines how fast the gate closes once the hold time has expired. The value is expressed as the duration required for the level to change by 6 dB.

■ DUCKING

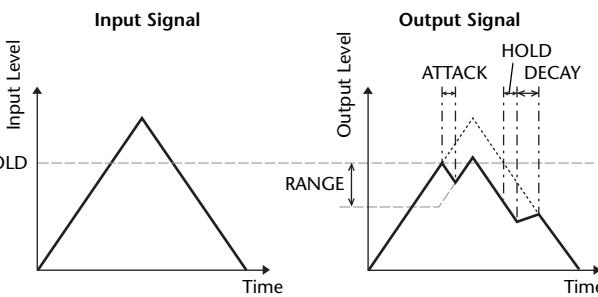

Ducking is commonly used for voice-over applications in which the background music level is reduced automatically when an announcer speaks. When the KEY IN source signal level exceeds the specified THRESHOLD, the output level is attenuated by a specified amount (RANGE).

Parameter	Range	Description
THRESHOLD	-72.0 to 0.0 (dB)	This determines the level of trigger signal (KEY IN) required to activate ducking.
RANGE	$-\infty$, -72.0 to 0.0 (dB)	This determines the amount of attenuation when ducking is activated.

Mixing parameter operation applicability

This table indicates which settings affect the behavior of each input channel, mix channel, matrix channel, stereo channel and DCA parameter.

The table also indicates whether the parameters can be linked for a stereo pair, or whether they can be the target of a GAIN GANG ON, DELAY GANG ON, RECALL SAFE, or FOCUS RECALL operation.

MIDI Data Format

This section explains the format of the data that the RIVAGE PM10 is able to understand, send, and receive.

1 CHANNEL MESSAGE

1.1 CONTROL CHANGE (Bn)

Reception

These messages are echoed to MIDI OUT if [CONTROL CHANGE ECHO] is ON.

These messages are received when [CONTROL CHANGE Rx] is ON and [Rx CH] matches, and will control parameters according to the settings of the [CONTROL CHANGE ASSIGNMENT]. For the parameters that can be assigned, refer to “[Parameters that can be assigned to control changes](#)” on page 41.

Transmission

If [CONTROL CHANGE Tx] is ON when you operate a parameter that is assigned in the [CONTROL CHANGE ASSIGNMENT], these messages will be transmitted on the [Tx CH] channel. For the parameters that can be assigned, refer to “[Parameters that can be assigned to control changes](#)” on page 41.

CONTROL CHANGE numbers 0 and 32 are for selecting banks.

STATUS	1011nnnn	Bn	Control change
DATA		00	Control number (00)
	0vvvvvvv	vv	Control Value (0-127)
STATUS	1011nnnn	Bn	Control change
DATA		20	Control number (32)
	0vvvvvvv	vv	Control Value (0-127)
STATUS	1011nnnn	Bn	Control change
DATA	0nnnnnnn	nn	Control number (1-5, 7-31, 33-37, 38-95, 102-119) *
	0vvvvvvv	vv	Control Value (0-127)

* Numbers 0, 32, and 96-101 cannot be used.

* Control number 6, 38 can be used.

Equation for converting a Control Value to parameter data

```
paramSteps = paramMax - paramMin + 1;
add      = paramWidth / paramSteps;
mod      = paramWidth - add * paramSteps;
curValue = paramSteps * add + mod / 2;
```

(1) If the assigned parameter has fewer than 128 steps

paramWidth = 128; rxValue = Control value;

(2) If the assigned parameter has 128 or more but less than 16,384 steps

paramWidth = 16384;

(2-1) When High and Low data is received

rxValue = Control value(High) * 128 + Control value(Low);

(2-2) When only Low data is received

rxValue = (curValue & 16256) + Control value(Low);

(2-3) When only High data is received

rxValue = Control value(High) * 128 + (curValue & 127);

(3) If the assigned parameter has 16,384 or more but less than 2,097,152 steps

paramWidth = 2097152;

(3-1) When High, Middle, and Low data is received

rxValue = Control value(High) * 16384 + Control value(Middle) * 128 + Control value(Low);

(3-2) When only Low data is received

rxValue = (curValue & 2097024) + Control value(Low);

(3-3) When only Middle data is received

rxValue = (curValue & 2080895) + Control value(Middle) * 128;

(3-4) When only High data is received

rxValue = (curValue & 16383) + Control value(High) * 16384;

(3-5) When only Middle and Low data is received

rxValue = (curValue & 2080768) + Control value(Middle) * 128 + Control value(Low);

(3-6) When only High and Low data is received

rxValue = (curValue & 16256) + Control value(High) * 16384 + Control value(Low);

(3-7) When only High and Middle data is received

rxValue = (curValue & 127) + Control value(High) * 16384 + Control value(Middle) * 128;

if (rxValue > paramWidth)

rxValue = paramWidth;

param = (rxValue-mod / 2) / add;

1.2 PROGRAM CHANGE (Cn)

Reception

If [PROGRAM CHANGE ECHO] is ON, bank select messages will also be echoed from MIDI OUT.

If SINGLE CH is selected, these messages are received if [PROGRAM CHANGE Rx] is ON and the [Rx CH] matches. However if [OMNI] is ON, these messages are received regardless of the channel. When these messages are received, scene memory, effect library and premium rack library are recalled according to the settings of the [PROGRAM CHANGE EVENT LIST].

Transmission

If [PROGRAM CHANGE Tx] is ON, these messages are transmitted according to the [PROGRAM CHANGE Table] settings when scene memory is recalled.

If SINGLE CH is selected, these messages are transmitted on the [Tx CH] channel.

If the recalled scene memory, effect library and premium rack library has been assigned to more than one PROGRAM NUMBER, the lowest-numbered PROGRAM NUMBER for each MIDI channel will be transmitted. You can choose either MULTI MIDI CH or SINGLE CH.

If SINGLE is selected

You can choose the Rx CH, OMNI CH, and Tx CH.

You can choose whether a bank select message will be added.

A bank of up to 16 can be specified.

If MULTI is selected

The Rx and Tx channels will be the same.

The assignment table will use the settings for each MIDI channel. Bank select messages will not be added.

You can make settings for up to sixteen MIDI channels.
